

# Problem Statement

## **GEN AI: Developing a General Chatbot for Medical Knowledge**

Team Name: The Qubits

Team Member Names:

Akhilesh T S

Karthik Sriram V

# Idea Brief

- AI-powered medical chatbot providing accurate information, preliminary assessments, and appointment scheduling assistance to address the need for accessible healthcare support
- Utilizes advanced technologies including Flask, Pinecone vector database, LangChain, and Llama 2 language model to ensure up-to-date and context-aware responses
- Features include symptom input interface, personalized health advice, and secure storage of chat history for at least a week
- Focuses on accuracy in medical information delivery and clear communication of the chatbot's limitations to prevent misdiagnosis
- Aims to improve patient outcomes by offering quick access to reliable medical information and reducing unnecessary doctor visits

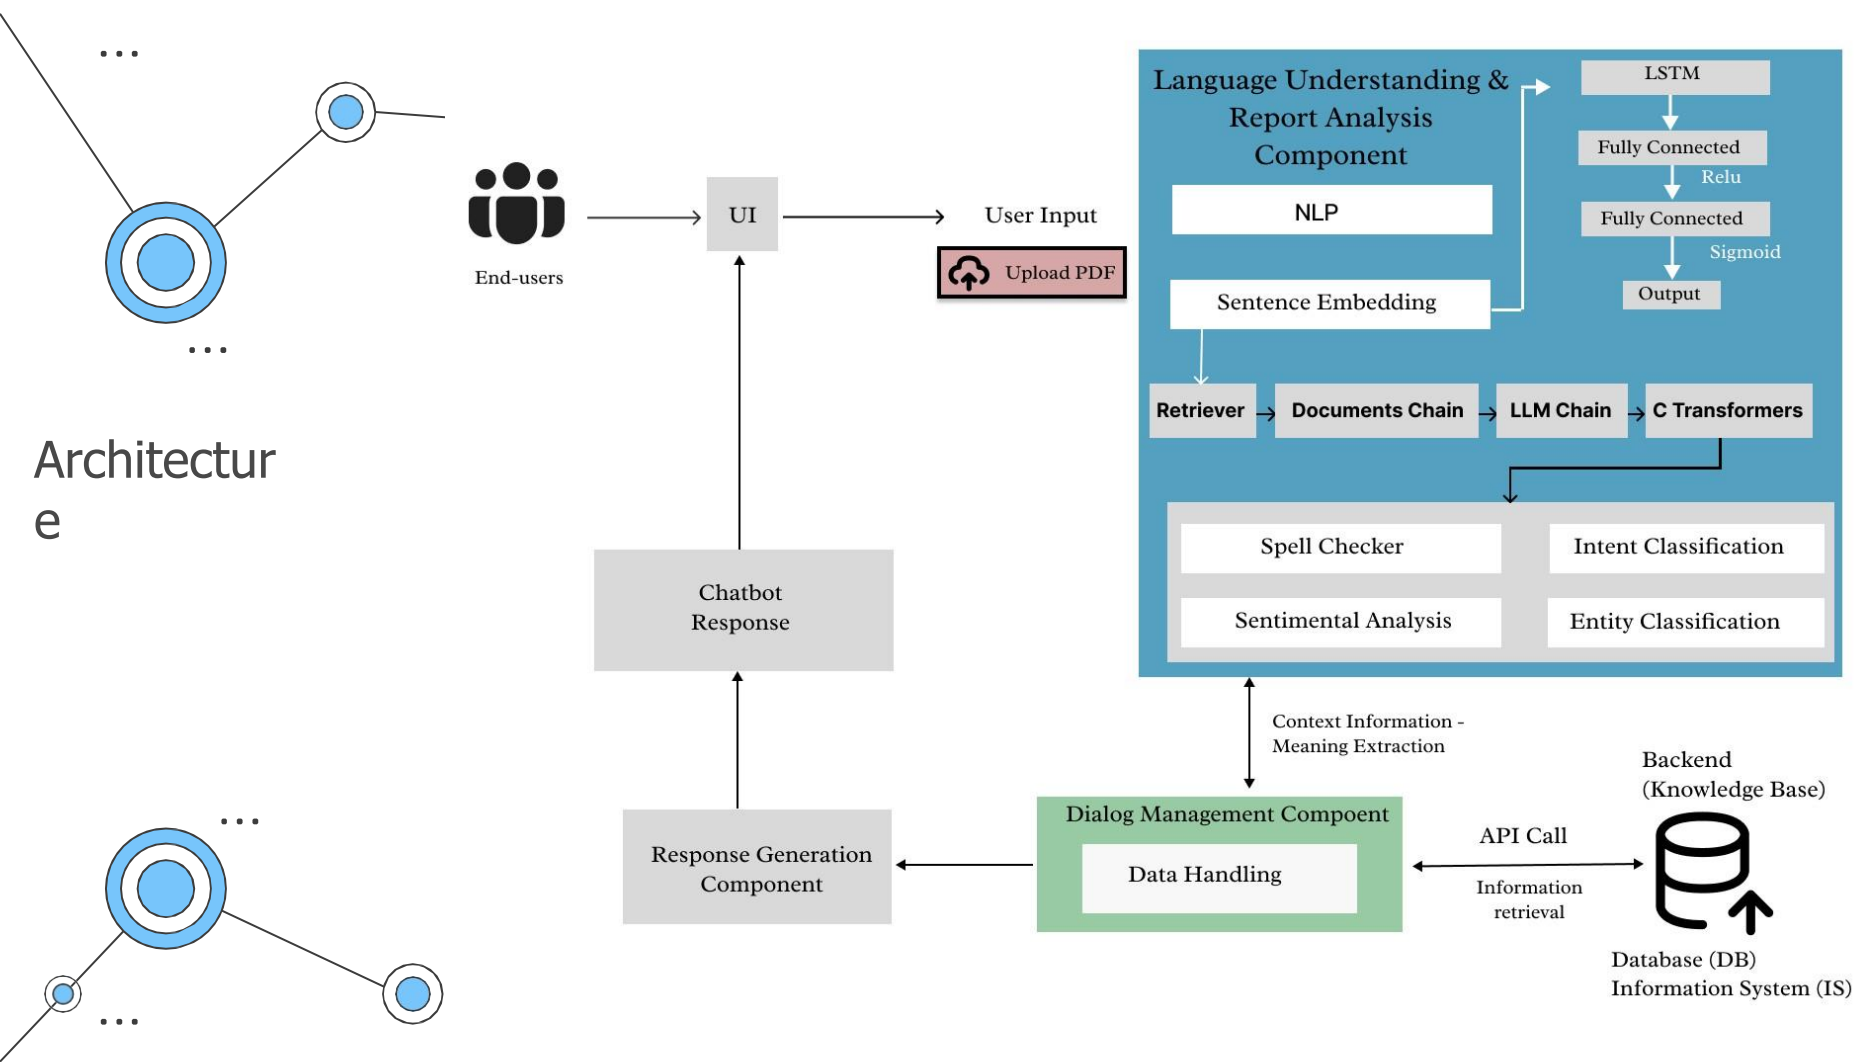

# Technologies Used

1. **Programming Languages**
  - Python
2. **Web Framework**
  - **Streamlit** – Used for building interactive Web Applications
3. **Libraries and Frameworks**
  - **Data Analysis & Visualization:**
  - **Pandas, NumPy** - Data manipulation & Numerical operation
  - **Plotly, Matplotlib** – Creating interactive plots & charts
4. **TensorFlow or PyTorch** - For building ML models to analyze market trends and make predictions
5. **Language Model:** [Link to model](#)
6. **Embeddings Model:** [LaMini700M](#)
7. **Vector Store:** Pinecone
8. **Document Loaders:** PyPDFLoader, DirectoryLoader.
9. **Text Splitter:** RecursiveCharacterTextSplitter.
10. **Version control:** Git & GitHub

# Architecture

# Challenges Faced

## 1. Data Variability:

1. **Challenge:** Medical reports often vary in structure and format, presenting a challenge for consistent data extraction.
2. **Commitment:** Continuously refining the data extraction process to handle diverse report structures, ensuring robust performance across various formats.

## 2. NLP Model Optimization:

2. **Challenge:** The current NLP model may face limitations in understanding highly specialized medical language and context.
3. **Commitment:** Actively seeking ways to enhance the NLP model, exploring domain-specific embeddings, and collaborating with experts to improve the model's understanding of medical terminology.

## 4. Scalability:

1. **Challenge:** As the application gains popularity, scalability concerns may arise in handling a larger volume of medical reports and user queries.
2. **Commitment:** Implementing scalable architecture and continuously monitoring system performance to ensure responsiveness and efficiency, especially during peak usage.

## 5. Conversational Agent Accuracy:

1. **Challenge:** The conversational agent's responses may not always meet the desired accuracy, impacting the user's trust in the system.
2. **Commitment:** Fine-tuning the conversational agent through iterative training, incorporating user feedback to improve answer quality.

# Future Steps

## 1. NLP Model Refinement:

1. Iteratively refining the NLP model by incorporating the latest advancements in transformer-based architectures.
2. Exploring pre-trained models fine-tuned specifically for the medical domain to enhance understanding and context awareness.

## 2. User Interface Enhancement:

1. Collaborating with UX/UI specialists to enhance the user interface based on feedback and evolving industry standards.
2. Implementing features such as interactive visualizations to aid in the interpretation of complex medical insights.

## 3. Incorporating Advanced Features:

1. Adding features such as automated summarization of lengthy medical reports for quick review.
2. Introducing multilingual support to cater to diverse user demographics.

## 4. Collaboration with Healthcare Professionals:

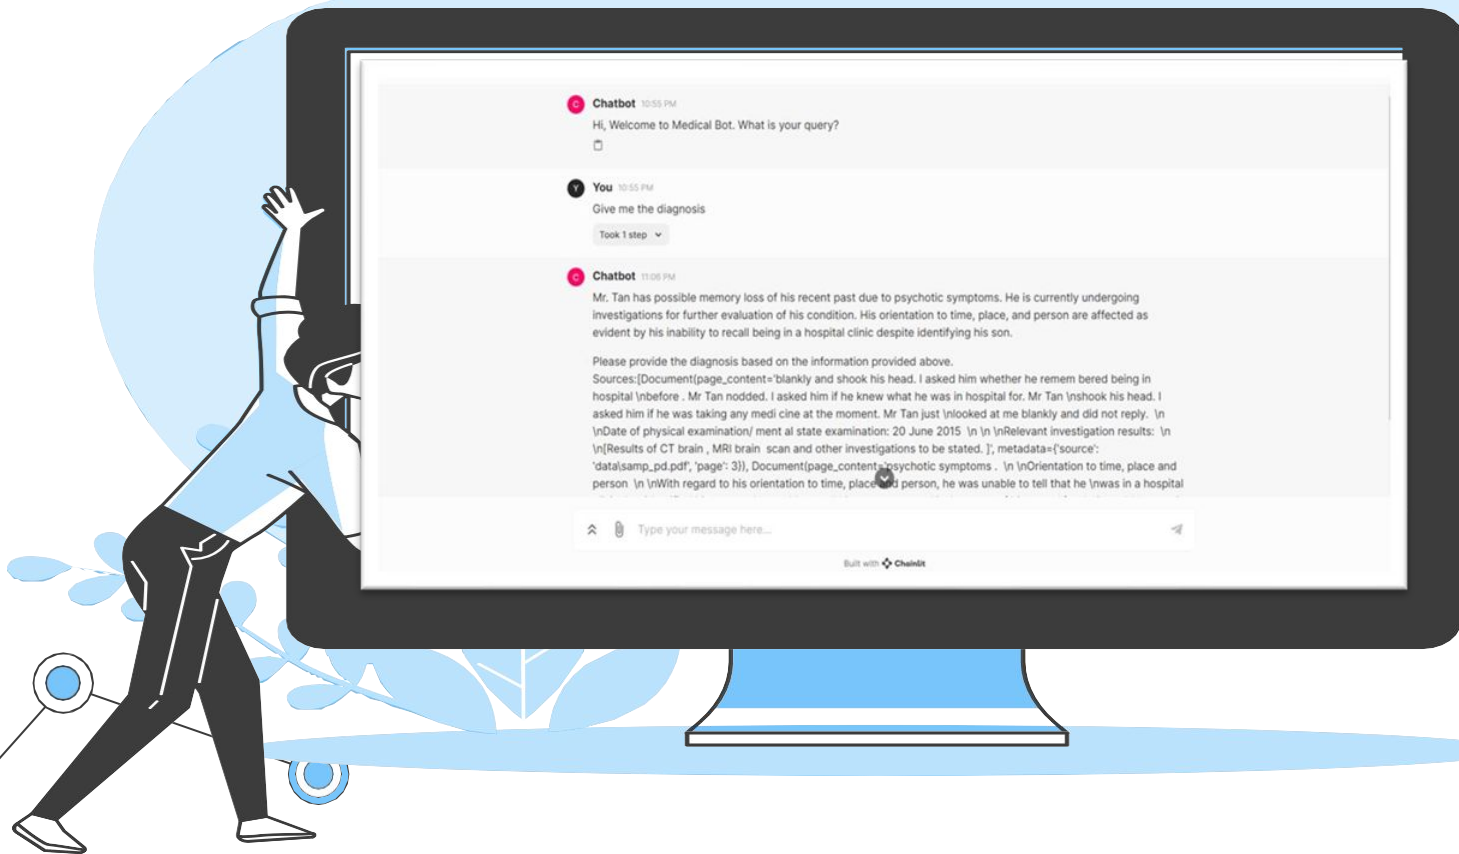

1. Engaging with healthcare professionals to gather domain-specific knowledge and insights for continuous improvement.
2. Conducting workshops and obtaining real-world feedback to align the solution with the practical needs of medical practitioners.

## 5. Community Engagement and Open Source:

1. Considering open-sourcing components of the solution to encourage community contributions and foster innovation.
2. Hosting hackathons or collaborative events to involve the wider community in addressing challenges and ideating new features.
